

How to Use IntelliChorus Recorder

Introduction

Welcome to IntelliChorus Recorder - an innovative, flexible, and screen reader-friendly tool by Unique Creators.

This script was designed for creative professionals and musicians who want a hands-free, organized way to record chorus layers or stacked takes in REAPER.

IntelliChorus automates track creation, arm/mute flow, punch-record logic, panning, and naming with friendly prompts!

1. Before You Start

- Ensure REAPER is installed and working.
- Make a time selection in your project (this defines your punch-in recording range).
- Make sure your microphone or input device is connected and configured.
- If you're using a screen reader like NVDA with Osara, you're fully supported!

2. How to Launch IntelliChorus

- Run the IntelliChorus Recorder script from REAPER's Action List.
- A single prompt with 9 easy fields will appear.
- Enter values separated by commas. Here's what each one means:

1. Number of Tracks

How many takes/voices you want to record. (1-50 recommended)

2. Max Pan (%)

Maximum stereo separation. Tracks alternate left/right from center.

3. Input Channel

Your mic/input number (usually 1 or 2).

4. Wrap Folder (yes/no)

Place all chorus tracks inside one folder track.

5. Mute Previous (yes/no)

Automatically mute previous takes to avoid overlap.

6. Count-In Once (yes/no)

Enable count-in only for the first track.

7. Save Project (yes/no)

Save the project after recording completes.

8. Track Name

The base name of the tracks, e.g., 'Chorus'. Auto-numbering is handled.

9. Inform Me (yes/no)

Choose whether to hear spoken feedback or be silent.

3. The Recording Process

- REAPER will record each track automatically one by one.
- If "Inform Me" is enabled, it will speak the current take name.
- It arms the new track, optionally mutes the previous, and starts recording.
- If "Count-In Once" is yes, it only stops before the first take for count-in.

You can cancel anytime by pressing SPACE. The system will stop cleanly.

4. What Happens After?

- If enabled, your project is saved.
- All tracks are neatly named and panned.

- The cursor returns to the start position.
- The script resets, so you can run it again safely.

All actions are grouped into one Undo block if you ever need to revert.

5. Tips for Best Use

- Start with 2-4 tracks to test your routing and mic.
- Use headphones while recording to avoid mic bleed.
- Keep "Mute Previous" ON for cleaner layers.
- Don't forget to make a time selection - it defines the record range!
- "Inform Me = no" is great when recording silently in front of others.
- You can map this script to a shortcut key like Ctrl+Alt+` for quick launching.
